TERMS & DEFINITIONS

DOING THINGS RIGHT

Efficient

DOING THE RIGHT THING

Effective

AIM:

To evaluate the performance of galactose screening kit in order to obtain

The answer

Am I giving accurate high and low values with this kit ?

Am I doing it continuously?

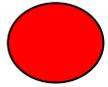

Collaboration

Between end-user and manufacturer

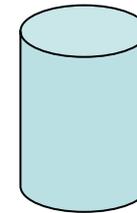

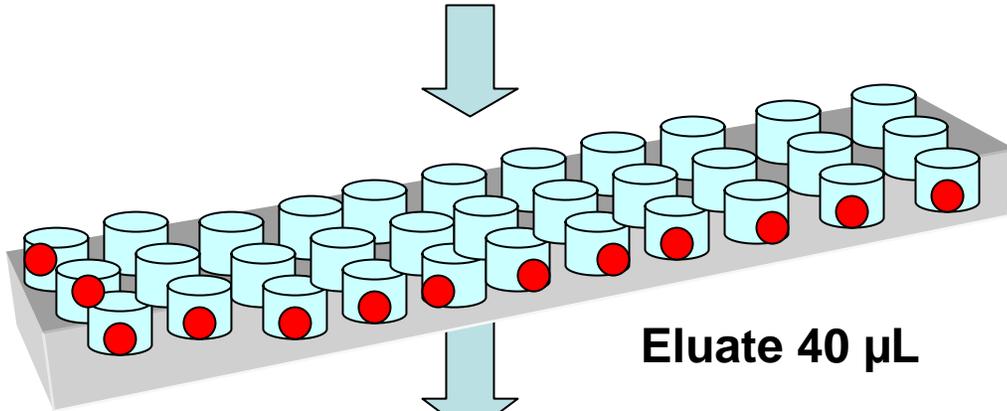

Tijen Tanyalcin (MD, PhD), TANYALÇIN TIP LABORATUVARI/TURKEY

George Reclos (PhD) R&D DIAGNOSTICS LTD/ GREECE

TOTAL GALACTOSE METHOD

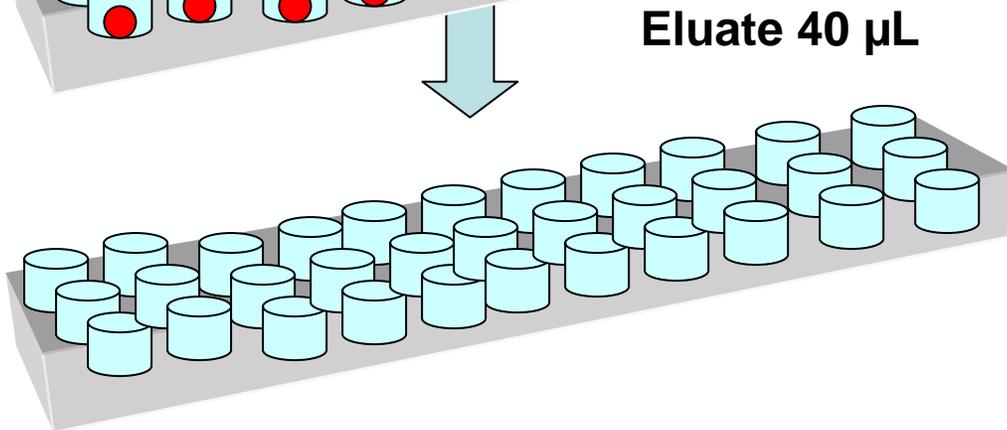

S&S903
3mm puncher

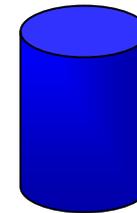

TCA 3 % 60 µL

Shaker 30 min

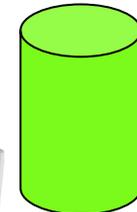

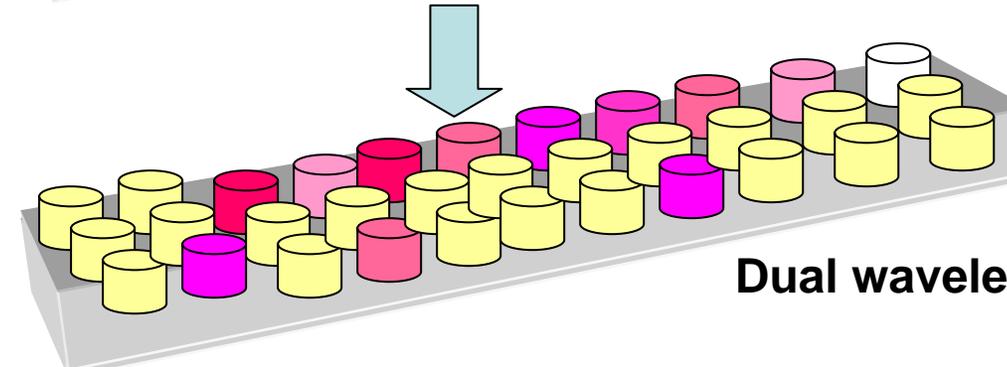

Eluate 40 µL

Reaction mixture
Alkaline Phosphatase
Galactose Dehydrogenase
NAD
100 µL

Shaker 30 min

NBT
Color reagent 80 µL

10 minutes after

Dual wavelength 570/690 nm measurement

Method Validation

- 1.Linearity
- 2.Repeatibility (within run, intra assay)
- 3.Reproducibility (between run , inter assay)
- 4.Detection limit analysis
- 5.Recovery
- 6.Interference study
- 7.Method comparison
- 8.
- 9.

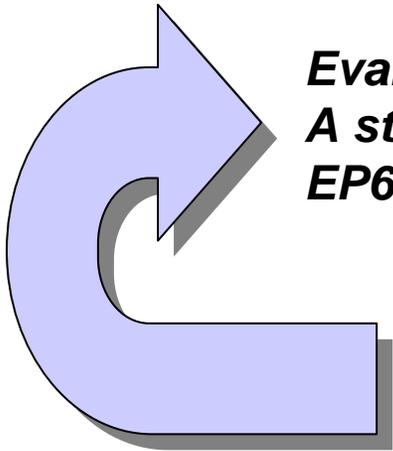

YOU make our own rules ,
Try to be realistic with the real life samples
Make **YOUR own cut off** and **YOUR own reference values**
Accurate interpretation of lab results (less false positives and
NO!!! false negatives)

LINEARITY CHECK

NCCLS Document

***Evaluation of the linearity of Quantitative Measurement Procedures:
A statistical Approach ; Approved Guideline
EP6-A 2003***

***Daniel W. Tholen
Clin Lab New ,January 2004***

LINEARITY

The ability to provide results that are directly proportional to the concentration of the analyte in the test sample

5 dilutions should be performed

1

Very low (1)

Intermediate (3)

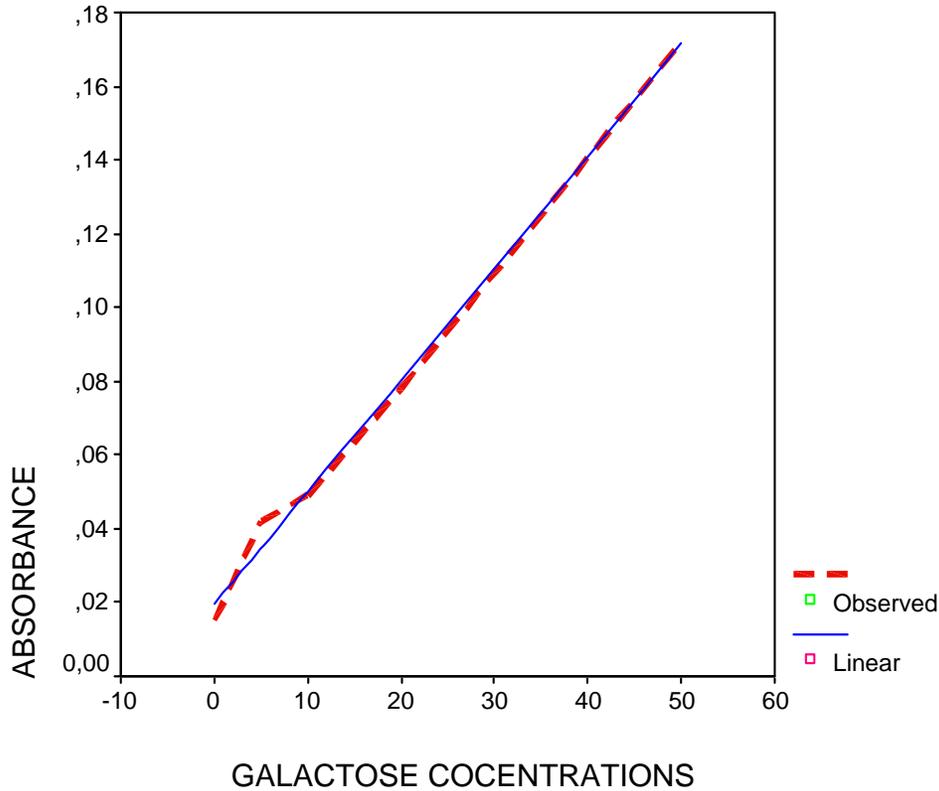

Very high (1)

2

Specimens should be free of known interferences

STEPS FOR LINEARITY CHECK

- ✓ First make your dilutions,
- ✓ Then from the average absorbance values, calculate the concentration from the linear regression
- ✓ Then take the +5% and -5% values to make the limits
- ✓ Then, calculate your concentration again from quadratic equation,
- ✓ Define again your +5% and -5% values to make the limits.
- ✓ When you take 5% of those values, check if they are inside the limits obtained from linear equation
- ✓ If they are, then your method can be accepted as linear.

LINEARITY CHECK GRAPH FOR TOTAL GALACTOSE

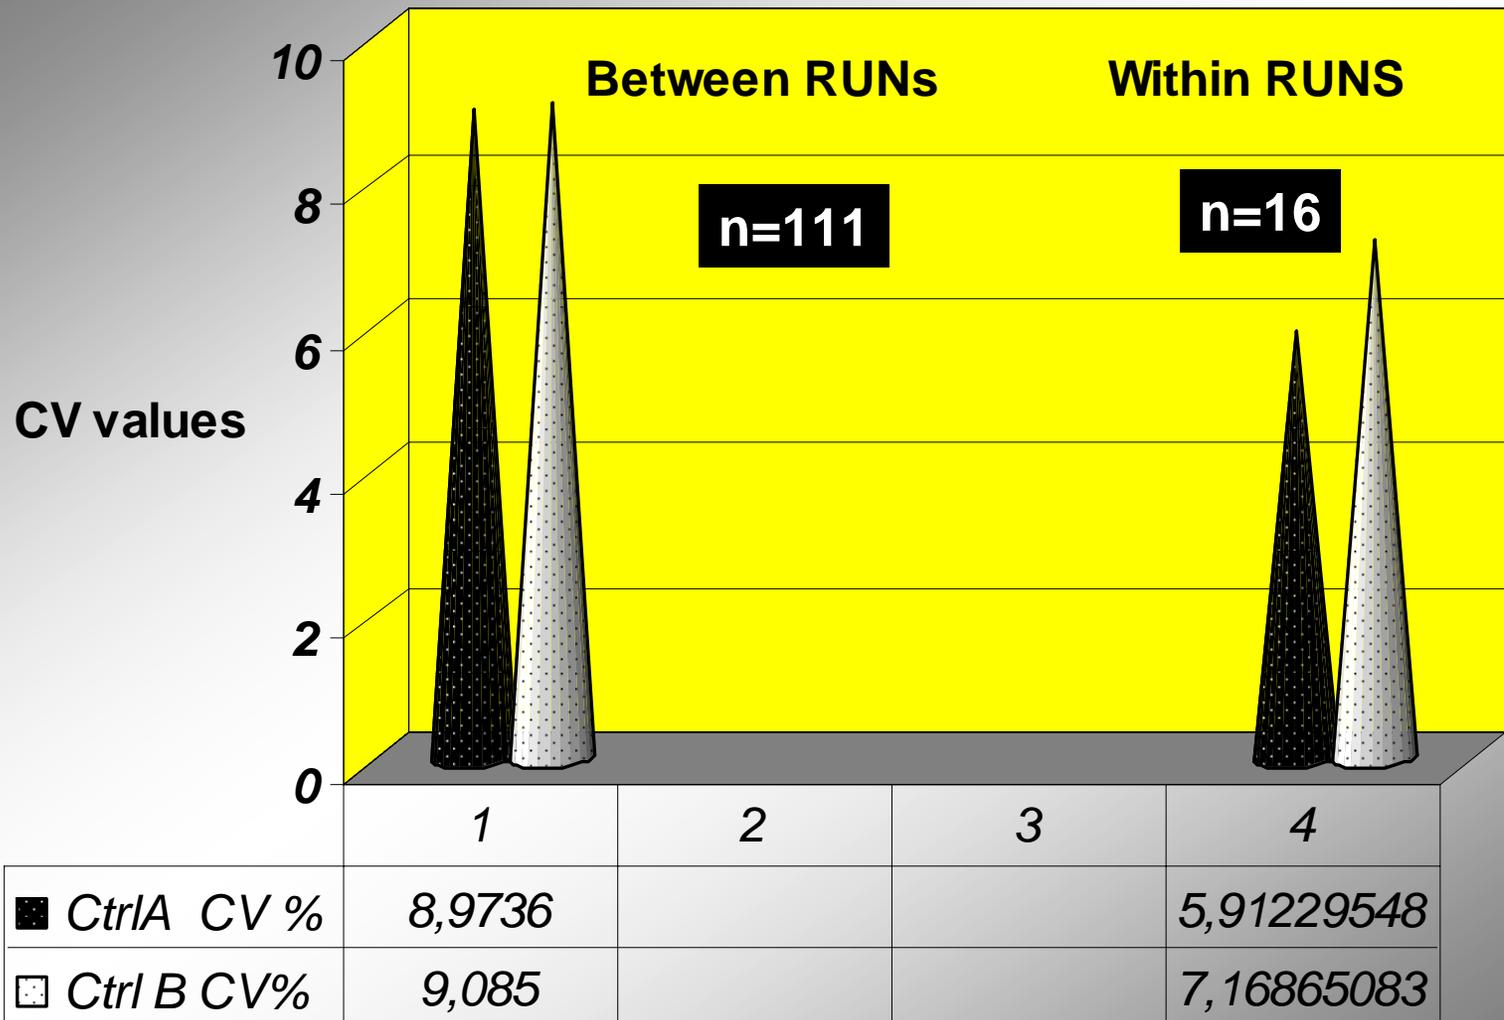

Long Term Value Of Controls

CTRL A 15 (12-18) mg/dL blood
CRTL B 25 (21,3-28,8) mg/dL blood

Repeatability / reproducibility (Within RUN / Between RUN assays)

DETECTION LIMIT

The limit defined as the smallest value that can be distinguished from zero with a defined degree of confidence

We may define the confidence by taking the

Mean (zero abs value) \pm 1 SD (68,2 %) or

Mean (zero abs value) \pm 2 SD ((95,5 %) or

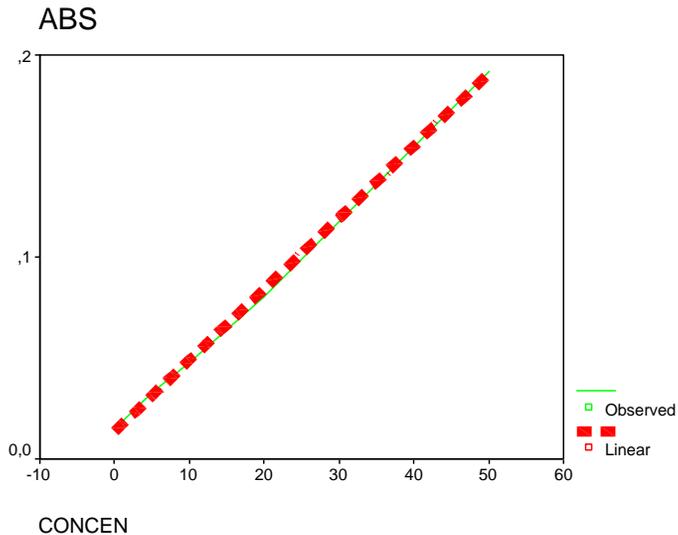

Mean (zero abs value) \pm 3 SD (99,7 %)

You can define the detection limit by extrapolating the imprecision measured at a very low concentration to zero

Detection limit determination

- 1. Punch 20 times a zero concentration (white spots) in one run**
- 2. Calculate the mean abs value from the curve**
- 3. Find the SD of absorbances and multiply by 2 (95,5% of distribution)**
- 4. Calculate the maximum mean abs value**
- 5. Place it at the linear equation and find the concentration**
- 6. Report your lab results according to your value**

DETECTION LIMIT CALCULATION

MODEL: MOD_1.
 Dependent variable.. ABS Method.. LINEAR

Multiple R ,99932
 R Square ,99864
 Analysis of Variance:

----- Variables in the Equation -----

Variable	B	SE B	Beta	T	Sig T
CONCEN	,003537	7,5469E-05	,999318	46,872	,0000
(Constant)	,013465	,001856		7,254	,0054

$Y = 0,003X + 0,013$ *Linear regression equation*

$Y = \text{MEAN abs (empty card)} + 2 \cdot \text{SD}$

$Y = 0,0145 + 0,00492 = 0,019$ ➔ $0,01942 = 0,003537 x + 0,013465$

X = 1,68

Any value lower than 1,68 should be reported as < 1,68

Not an actual figure.

DO I FIND ALWAYS THE SAME VALUE ?

NOOOOO!!!!

What affects the variability ??

BLOOD SPOT CARDS ????

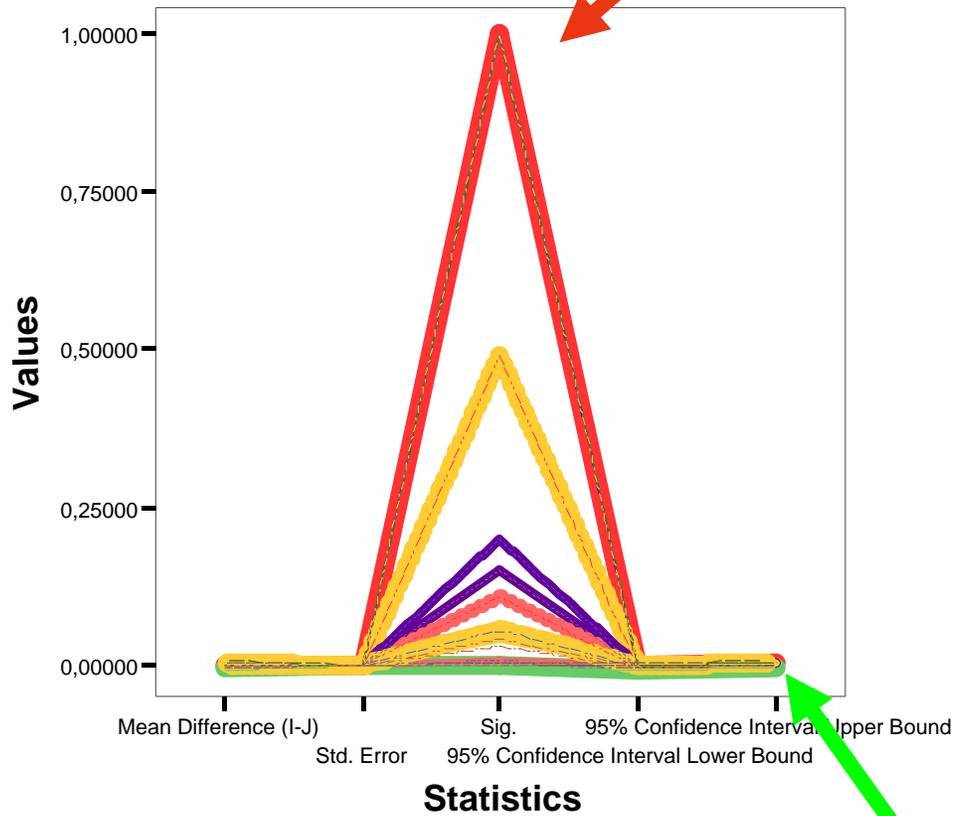

YESSSS!!!!!!

CONCLUSION

We can give confidently the results now

But still, what about the long term acceptability of the performance of the test ?

Currently, using reference range based goals :

CV should not exceed 1/8 of the width of reference range expressed as a percentage of the mean of that range

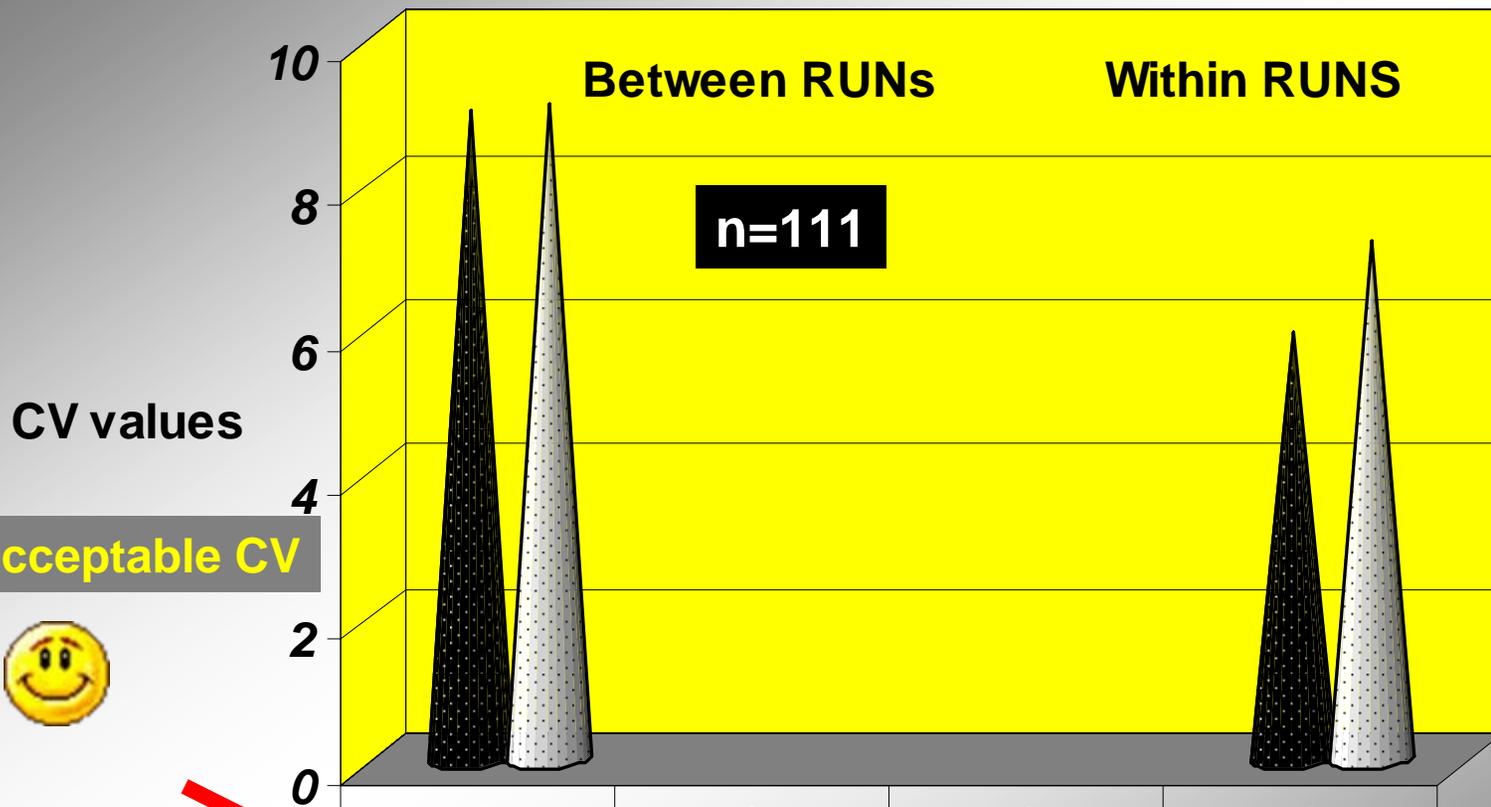

Example: For galactose 1,68 – 10 mg/dL blood

$$X = (10 - 1,68) / 8 = 1,04$$

$$\text{Mean} = 5,84$$

$$(1,04 / 5,84) * 100 = 17,80 \%$$

Repeatability / reproducibility (Within RUN / Between RUN assays)

	1	2	3	4
■ <i>Ctrl A</i> CV %	8,9736			5,91229548
□ <i>Ctrl B</i> CV%	9,085			7,16865083

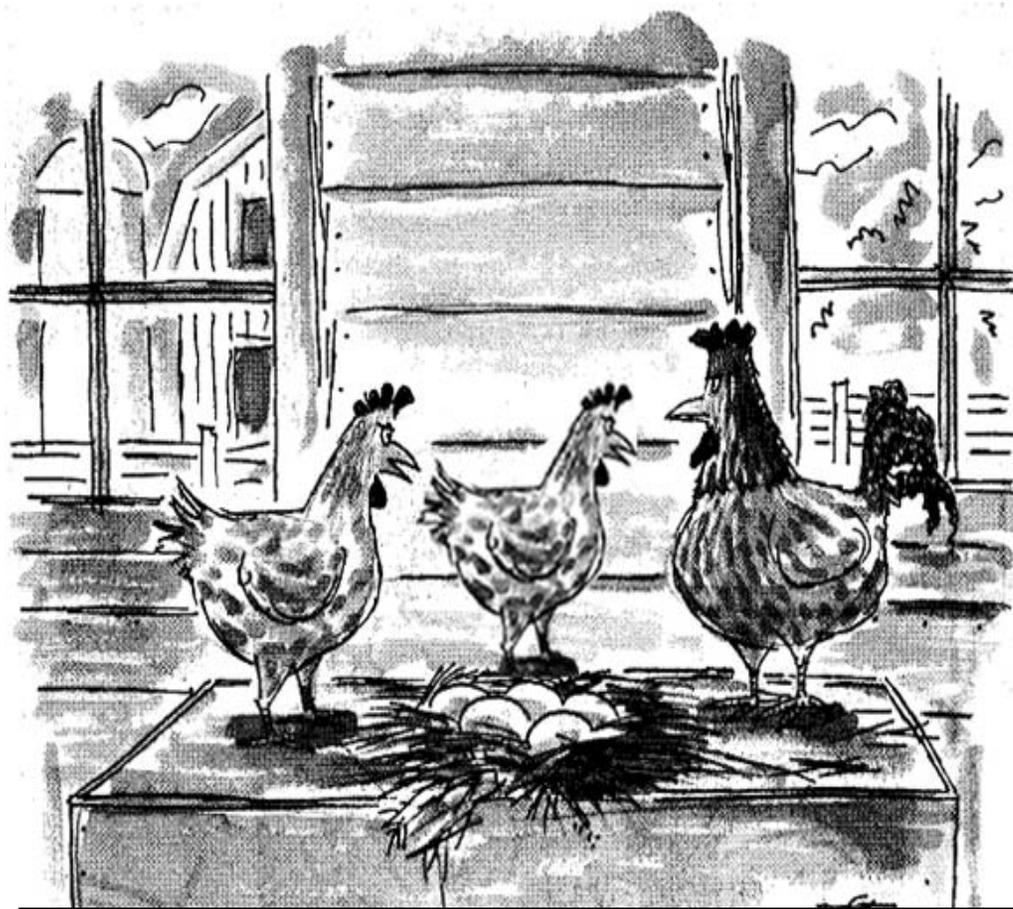

CONCLUSION

We have to know the total allowable error for galactose screening test

**This is also essential for all other dried blood spot screening tests like
PKU, MSUD, as well as enzymatic assays like GALT, G6PD
The total allowable error must be clearly defined**

Biological variations should be determined

The Quality Alliance Working Together

**They're not just our eggs,
they're your eggs too!**

Thank you
